Chapter 5 Problem 16
Chapter 4 Problem 14

## Chapter 5,Problem No 16

## - Evaluate the sum

$$
\sum_{k}\left(\begin{array}{c}
2 a \\
a+k
\end{array}\right]\left[\begin{array}{c}
2 b \\
b+k
\end{array}\right]\left[\begin{array}{c}
2 c \\
c+k
\end{array}\right](-1)^{k}
$$

## Continued...

The binomial coefficient $\left[\begin{array}{l}n \\ k\end{array}\right]$ can be
expressed in terms of factorials as follows:
( n ) $=\mathrm{n}!/\left(\mathrm{k}!^{*}(\mathrm{n}-\mathrm{k})!\right)$
k

## Continued...

Lets try to express each of the terms in the problem in factorials :

$$
\begin{aligned}
\left(\begin{array}{c}
2 a \\
a+k
\end{array}\right] & =\frac{(2 a)!}{(2 a-(a+k))!*(a+k)!} \\
& =\frac{(2 a)!}{(a-k)!} \cdot
\end{aligned}
$$

## Continued...

Similarly,

$$
\begin{aligned}
& \binom{2 b}{b+k}=\frac{(2 b)!}{(b-k)!^{*}(b+k)!} \\
& \binom{2 c}{c+k}=\frac{(2 c)!}{(c-k)!^{*}(c+k)!}
\end{aligned}
$$

## Continued...

Therefore,

$$
\sum_{k}\left(\begin{array}{l}
2 a \\
a+k
\end{array}\right]\left[\begin{array}{l}
2 b \\
b+k
\end{array}\right)\left[\begin{array}{l}
2 c \\
c+k
\end{array}\right)(-1)^{k}
$$

$=\sum(2 a)!(2 b)!(2 c)!\quad(-1)^{\mathrm{k}}$
k (a-k)! (a+k)! (b-k)! (b+k)! (c-k)! (c+k)!

## Continued...

## Multiplying numerator and denominator by

(a+b)! * $(b+c)$ ) * $(c+a)$ !
We will therefore have,
$\left.\frac{(2 a)!(2 b)!(2 c)!}{(a+b)!(b+c)!(c+a)!}\right)_{k} \frac{(a+b)!(b+c)!(c+a)!(-1)^{k}}{(a-k)!(a+k)!(b-k)!(b+k)!(c-k)!(c+k)!}$

Constant
Lets try to get a known form for this.

## Continued...

## Considering :

$$
\begin{aligned}
& \sum(a+b)!(b+c)!(c+a)! \\
& \text { k (a-k)! (a+k)! (b-k)! (b+k)! (c-k)! (c+k)! } \\
& =\sum_{k} \frac{(a+b)!}{(a+k)!(b-k)!} \quad(b+c)!\quad(c+k)!(c-k)!\quad(c+k)!(a-k)!
\end{aligned}
$$

(Just interchanging the order of the terms in the denominator)
We know that,
$\frac{(a+b)!}{(a+k)!(b-k)!}=\binom{a+b}{a+k}$

Continued...

Similarly,
$\frac{(b+c)!}{(b+k)!(c-k)!}=\binom{b+c}{b+k}$

$$
\frac{(c+a)!}{(c+k)!(a-k)!}=\binom{c+a}{c+k}
$$

## Continued...

## Therefore,

$$
\sum_{k} \frac{(a+b)!(b+c)!(c+a)!^{*}(-1)^{k}}{(a-k)!(a+k)!(b-k)!(b+k)!(c-k)!(c+k)!}
$$

$$
=\sum_{k}\left(\begin{array}{l}
a+b \\
a+k
\end{array}\right] \quad\left[\begin{array}{l}
b+c \\
b+k
\end{array}\right] \quad\left(\begin{array}{l}
c+a \\
c+k
\end{array}\right]^{*}(-1)^{k}
$$ which is a known form.

Using the equation given in Textbook Page No . 171,Eq. 5-29.
We have,
$\sum_{k}\binom{a+b}{a+k} \quad\binom{b+c}{b+k} \quad\binom{c+a}{c+k} \quad *(-1)^{k}=\frac{(a+b+c)!}{a!b!c!}$

## Solution

Thus, the solution for the problem becomes:
$\frac{(2 a)!(2 b)!(2 c)!}{(a+b)!(b+c)!(c+a)!} \quad \underbrace{} \quad \frac{(a+b+c)!}{a!b!c!}$

## Chapter 4, Problem No 14

Does every prime occur as a factor of some Euclid number $\mathrm{e}_{\mathrm{n}}$ ?

## Continued...

## Euclid Number :

Definition :
Euclid numbers are integers of the
form $E n=p_{n} \#+1$,
where $p_{n} \#$ is the primorial of $p_{n}$ which is the $n$th prime.

## Continued...

They are named after the ancient Greek mathematician Euclid, who used them in his original proof that there are an infinite number of prime numbers.
Primorial :
For $n \geq 2$, the primorial ( $n \#$ ) is the product of all prime numbers less than or equal to $n$. For example, $7 \#=210$ is a primorial which is the product of the first four primes multiplied together $(2 \cdot 3 \cdot 5 \cdot 7)$.

## Continued...

The simplest argument could be that to show that there is a prime number which is never the factor of any Euclid number. If we consider any Euclid number, $p_{n} \#$ is always a multiple of 2 .
And Euclid number is 1 added to $p_{n} \#$.

## Continued..

Every Euclid number is of the form
$=(2 * k)+1$
where " $k$ " is product of prime numbers $<=n$ excluding 2.
So, it is very clear that there exists no
Euclid number which is divisible by 2.

## Answer

Hence, the answer is :
Every prime cannot occur as a factor of some Euclid number $\mathrm{e}_{\mathrm{n}}$.

THANK YOU
