Discrete Surfaces

Acquired using 3D scanner.

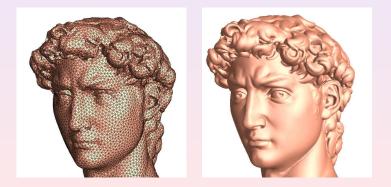

Our group has developed high speed 3D scanner, which can capture dynamic surfaces 180 frames per second.

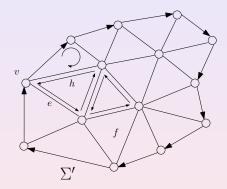

A B > A B >

- Surfaces are represented as polyhedron triangular meshes.
- Isometric gluing of triangles in \mathbb{E}^2 .
- Isometric gluing of triangles in $\mathbb{H}^2, \mathbb{S}^2$.

- Topology Simplicial Complex, combinatorics
- Conformal Structure Corner angles (and other variant definitions)
- Riemannian metrics Edge lengths
- Embedding Vertex coordinates

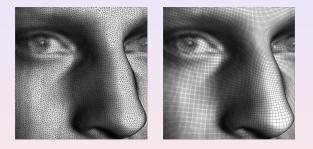

David Gu Conformal Geometry

Definition (Mesh)

A triangle mesh is a oriented two dimensional simplical complex, generally embedded in \mathbb{R}^3 .

Our goal is to design a data structure to efficiently represent general meshes.

David Gu Conformal Geometry

E

fundamental classes

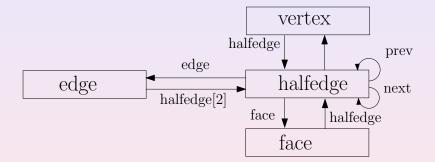

- Vertex
- Halfedge, oriented edge
- Edge, non-oriented edge
- Face, oriented

Links

All objects are linked together through pointers, such that

- The local Eucler operation can be easily performed
- 2 The memory cost is minimized

E

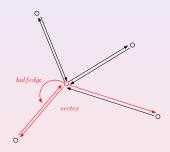

- Halfedge pointers: prev, next halfedge;
- Vertex pointers: target vertex, source vertex;
- Edge pointer: the adjacent edge;
- face pointer: the face it belongs to;

< □ > < □ > < □ > < □ >

★ 문 → 문

• Halfedge pointers: the first in halfedge

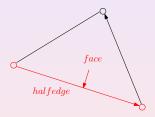

◆□ > ◆□ > ◆三 > ◆三 > ・三 のへで

- Halfedge pointers: to the adjacent two halfedges.
- if the edge is on the boundary, then the second halfedge pointer is null.

◆□ → ◆□ → ◆ □ → ◆ □ → ◆ □ → ◆ ○ ◆

• Halfedge pointers: to the first halfedge.

Mesh class

Data members

- A list of vertices;
- A list of halfedges;
- A list of edges;
- A list of faces;

★ 문 ▶ 문 문

Euler Operation

circulating neighbors of a vertex $v \rightarrow v/e/f/h$

- iterate out-halfedges counter-clock-wisely
- iterate in-halfedges counter-clock-wisely
- iterate neighboring faces CCWly
- iterate neighboring vertices CCWly

Rotate a halfedge about its target vertex clwly:

$$he = he \rightarrow next() \rightarrow dual();$$

Rotate a halfedge about its target vertex ccwly:

$$he = he \rightarrow dual() \rightarrow prev();$$

・ロト ・回ト ・ヨト ・ヨト

Euler Operation

circulating neighbors of a face $f \rightarrow v/e/f/h$

- iterate halfedges ccwly
- iterate edges ccwly
- iterate vertices ccwly
- iterate faces ccwly

Circulate halfedges of a face ccwly:

 $he = he \rightarrow next()$

circulate halfedge of a face clwly:

$$he = he \rightarrow prev();$$

Attributes

Each object stores attributes (traits) which defines other structures on the mesh:

- metric structure: edge length
- angle structure: halfedge
- o curvature : vertex
- o conformal factor: vertex
- Laplace-Beltrami operator: edge
- Ricci flow edge weight; edge
- holomorphic 1-form: halfedge
